Twin Engine (PHEV) Technology 17
  - Introducing Twin Engine Technology
  - T8 Twin Engine AWD
  - Electric Rear Axle Drive (ERAD)
  - Crank-Integrated Starter Generator (C-ISG)
  - High Voltage Battery
Volvo Cars’ Drive-E powertrain technology is based on the concept of efficient power, without compromise. Our modular approach to powertrain engineering means that the same base engine architecture can deliver two distinctive powertrain attributes.

**Clean Efficiency**
All of our Drive-E powertrains are designed to improve fuel economy and reduce emissions. Our Drive-E four-cylinder powertrains have improved fuel efficiency by up to 35 per cent compared to our previous powertrain line-up while also delivering weight savings of up to 45 Kg.

**Responsive Power**
Our award-winning four-cylinder engines come with advanced boosting technology that delivers responsive power when desired through the innovative use of both turbo and supercharging.

Drive-E powertrain technology delivers the performance and drivability expected by our target customers.

**Electrification**
Volvo Cars’ engine technology, along with our new scalable platform architecture SPA, are designed with the future in mind. Volvo Cars launched the world’s first diesel plug-in hybrid in 2012. In 2015 we launched the world’s cleanest and most powerful 7-seat plug-in hybrid SUV: the XC90 T8 Twin Engine. Twin Engine technology will be available on all of Volvo Cars’ future product architectures.

Volvo Cars remains at the forefront of innovation in the field of powertrain engineering. We firmly believe that electrification and hybridization reflect the future.
Modularity

One of the developmental principles and key benefits behind our award-winning Drive-E powertrains is that they were designed to reduce complexity by using a compact, modular approach.

This effectively means that both diesel and petrol models share a common architecture and can therefore be produced on the same lines in our engine plants.

The efficient design of the architecture also means that a broad range of engine power variants can be achieved with bolt-on power boosting turbo- and superchargers, coupled with bespoke engine software.
Petrol Engine Technology

Advanced Boosting
Volvo Cars has taken advanced boosting to a new level, using a modular based system that effectively offers Volvo owners a range of power levels and engine performance attributes. Advanced boosting means that our compact engines can deliver power levels equivalent to those of larger six- and eight-cylinder units. Advanced boosting also ensures high torque availability across a wider speed range.

We use state-of-the-art charging systems consisting of turbochargers and superchargers designed to our precise specifications to deliver improved fuel economy, leading performance and drivability.

Supercharger & Turbos
Superchargers deliver low-end torque and response. Turbos deliver horsepower. Below 3500 rpm the supercharger and turbo are active. Above 3500 rpm, only the turbo is applied.

Supercharger & Turbo (T6)
Advanced Combustion
The combustion system designed for the petrol engines is comprised of a centrally mounted spark plug and injector with a unique spray layout that provides a homogeneous air-fuel mixture.

This central direct injection technique enables:
• Stratified start and an effective catalyst heating mode that outperforms Port Fuel Injection (PFI) and side mounted Direct Injection engines, resulting in low fuel consumption and enabling Euro6 and LEVIII emission compliance.
• Improved low-end torque compared with PFI by using scavenging and charge cooling by direct fuel injection.

The intake ports are designed to generate a high tumble motion, promoting the mixing of air and fuel during the intake stroke. In the succeeding compression stroke, this tumble motion is broken down into turbulence, accelerating the combustion speed. The combustion is therefore very stable, enabling a high degree of internal EGR, which minimizes pumping losses, hence reducing the fuel consumption. Special efforts were made to achieve a combustion system that is knock resistant. The cooling water jacket, intake ports, spray target and combustion chamber geometry were fine-tuned, enabling a fuel-efficient, high compression ratio of 10.8 for the gasoline T5 and 10.3 for the gasoline T6.

Petrol Engines
Diesel Engine Technology

Advanced Boosting
Volvo Cars’ modular approach to advanced boosting also applies to the diesel engines in the Drive-E powertrain line-up.

Consisting of a serial sequential **two-stage** turbo system, it is based on a refined version of the boosting technology first introduced in Volvo cars in 2008.

Once again, advanced boosting enables the delivery of increased power and drivability, but with lower fuel consumption. The two-stage turbo also allows both low and high-speed response.
With PowerPulse, Volvo Cars has developed an innovative way of delivering instant turbo response in diesel engines providing a distinct performance feel that many car makers struggle to achieve in their diesel variants.

PowerPulse works by drawing air from the air filter via a compressor to a pressurised two-litre air tank.

When the driver wishes to accelerate quickly during launch and during low-speed driving, the air is fed by a valve into the exhaust manifold to feed the turbo. This has the effect of delivering a quick and responsive pulse of power.

The air in the tank is topped-up automatically, making sure that PowerPulse is always ready to deliver a new boost.

Volvo Cars is the only car maker currently using such technology in production cars.
Advanced Combustion

i-Art represents the latest diesel fuel system technology.

The system rail pressure of up to 2,500 bar is increased compared to previous systems of 1800 to 2000 bar. Thanks to a pressure sensor and an intelligent chip in each injector, it is possible to get vast and accurate feedback, resulting in much improved control of the injected fuel quantity.

This accurate and compensating injection system delivers up to 9 injections per combustion for precise combustion control. As each injector responds to real-time changes in its cylinder it means that the constantly variable injection can compensate for variations due to production and aging of the system.

This precise control of the combustion cycle means that consumption can be balanced to meet state of the art attribute levels and deliver up to 2 percent improved fuel efficiency. Volvo Cars was the first European car maker to introduce i-Art Technology in its cars.

i-Art is a Denso Cooperation trade mark, intelligent Accuracy Refinement Technology.

Diesel Engines

D5 Rear

D4 Rear

D3/D2 Rear
The Volvo eight-speed planetary automatic transmission is a vital part of Drive-E powertrain technology. The number of gears means that the engine’s torque and power band can be utilized more efficiently. Two of the gears are ‘overdrives’, which save fuel when cruising at constant speeds.

The lock-up system is comprised of the latest NVH damping technology (pendulum damper for diesels and super long travel damper for the petrol engine). This enables frequent use of the lock-up and allows the engine to run on low revs for best fuel economy.

The T8 Twin Engine variant has a unique engine-braking mode. The maximum torque level is also increased to enable better use of the C-ISG for performance boosting purposes.

The Volvo six-speed planetary automatic transmission is a vital part of Drive-E powertrain technology for medium torque powertrains.

The six-speed transmission shares the same technology as the eight-speed transmission. The difference is the number of speeds and the adaptation for medium torque levels.
This manual gearbox is a new generation of our well proven six-speed manual gearbox. New gear sets and efficiency work have made it smoother and even more fuel efficient. Combined with the new external shifter design, the gear positions are more exacting and solid.

This gearbox will also be available in an All-Wheel Drive application for products based on our Scalable Product Architecture (SPA).

6-speed Manual - High Torque

- 450Nm transmission
- Light weight ~54 kg
- New optimized gear sets and final drives to provide good drivability and fuel economy.

This manual gearbox is a new generation of our well proven six-speed manual gearbox. New gear sets and efficiency work have made it smoother and even more fuel efficient. Combined with the new external shifter design, the gear positions are more exacting and solid.

This gearbox will also be available in an All-Wheel Drive application for products based on our Scalable Product Architecture (SPA).

6-speed Manual - Medium Torque

- 330Nm transmission
- Light weight ~42 kg
- Optimized gear sets and final drives to provide good drivability and fuel economy.

This is a new manual transmission developed for Volvo Cars’ medium torque applications. Excellent shifting is achieved thanks to low internal inertia and a new shifting mechanism. A huge improvement made on torque to weight ratio has been achieved with this new transmission.
All-Wheel Drive

ALL-WHEEL DRIVE
The all-wheel drive variants have a very efficient type of four-wheel drive system. A compact and lightweight coupling (BorgWarner Gen. 5) distributes the engine’s power between the front and rear wheels. Under normal, dry conditions practically all of the power is distributed to the front wheels. The system constantly calculates the need for torque to the rear wheels and can instantly redistribute up to 50 per cent of the engine’s torque to the rear wheels. When at a standstill, full all-wheel drive is always engaged to prepare for maximum traction during acceleration.
Twin Engine Technology

Plug-in hybrids

“Volvo Cars has made a clear commitment to electrification across our entire product range. Our Twin Engine technology is a confident first step forward. This technology delivers a no compromise balance of clean, efficient performance and exceptional driving pleasure. It is all about using the latest available technology to address unmet consumer needs,” says Dr Peter Mertens, Senior Vice President Research & Development at Volvo Car Group.

Twin Engine Definition

Volvo’s Twin Engine technology is essentially a combination of an internal combustion engine and electric power. Electric energy from the grid can be stored in a High Voltage Battery. The technology is more commonly known as Plug-in Hybrid Technology (PHEV).

Volvo’s technology is designed to deliver three cars experiences in one.

• PURE – where the car runs on electric power alone.
• HYBRID – where an optimal combination of the engine and electric machine propels the cars in a balanced and sustainable way.
• POWER – where all available power is used to deliver maximum performance.

Volvo’s Twin Engine set-up means that the high voltage battery is positioned in the tunnel console for maximum safety and also improved weight distribution that gives an improved driving experience.

Twin Engine technology delivers a no compromise mix of performance, driving pleasure, efficiency interior, cargo space and flexibility.
